

SO, YOU WANT ME TO BELIEVE

that I can stick little black boxes on my equipment, and my accounting system will magically know what job they worked on and for how long?

Yes. Except it's not actually magic. Resource Commander® provides an ingenious solution for equipment tracking that seamlessly brings together all of the critical pieces. Using cutting edge technologies like GPS and wireless data and , information about your equipment's location and activity is sent to Resource Commander. These records are then matched automatically against jobs in your accounting system. If there is no match, or multiple matches, you easily pick from the list. Once you're happy with how it looks, it's just one click away from your accounting, job cost and project management systems.

It's that simple. Not a single piece of paper changes hands, and nothing gets re-keyed. Even we have to admit, the results do seem magical. If these are the kind of results you're in the market for, take a few minutes and see for yourself what Resource Commander can do.

Call us at (800) 227-6803 or visit www.acs-connect.com to schedule your personalized demo.

The Ultimate in Automated Equipment Tracking

- 1** Resource Commander receives location and activity information from wireless units installed on remote vehicles and equipment.
- 2** For each unit, GPS location is checked against job addresses from the accounting system. Based on activity rules defined by an administrator, fully costed operating and/or rental charges are automatically generated. Exceptions are presented for review, and handled in minutes.
- 3** Once approved, all of these records are then fed directly into the accounting system. Optionally, any maintenance information provided by the wireless unit can also be uploaded if the accounting system has an equipment maintenance module.

Resource Commander allows equipment without telematics to be tracked using a PC, laptop or web-enabled mobile device. For companies using Resource Commander for construction time and attendance, a piece of equipment can also be added to an employee's time record.

Resource Commander integrates with the most popular construction software packages available, such as the following job cost accounting and project management systems:

- JD Edwards 1World & E1
- Computer Guidance Corporation CMS & eCMS
- Dexter + Chaney Forefront & Spectrum
- Viewpoint Construction Software
- AMSI Starbuilder & CS1000
- Meridian Systems Prolog Manager
- Many more...

Resource Commander is capable of retrieving location, activity and available maintenance information from most North American telematics (Vehicle GPS) providers.
